INTRODUCTION

Montana's Constitution and laws require the Department of Revenue to reappraise all property periodically and value similar property across the state in the same manner.

This manual provides a general overview of the mass appraisal process the department uses to determine the market value of residential, commercial and industrial property. Market value is the value at which property would change hands between a willing buyer and a willing seller neither being under any compulsion to buy or to sell and both having reasonable knowledge of relevant facts. <u>15-8-111, MCA</u>.

Steps in the valuation process are:

- 1. Identification of property to be appraised;
- 2. Collection of data;
- 3. Valuation of land;
- 4. Development of valuation models and application of the three approaches to value when appropriate; and
- 5. Reconciliation and determination of final value.

1. IDENTIFICATION OF THE PROPERTY TO BE APPRAISED

The department identifies all residential, commercial, and industrial land and improvements as of January 1 of each year as required for certification of taxable values to every taxing and special jurisdiction in local governments for property tax purposes. <u>15-8-201, MCA</u>.

January 1, 2020 is the mass appraisal valuation date for the 2021-2022 valuation cycle. 15-7-111, MCA.

2. COLLECTION OF DATA

PROPERTY CHARACTERISTICS DATA

The department conducts property inspections and electronic desk audits to collect property characteristics data needed to complete a mass appraisal. A mass appraisal's quality is incumbent on the accuracy of the data collected on each property.

Department appraisers conduct property reviews each year. Common reasons why a property inspection or electronic desk audit are completed include:

- Property sales verification
- New construction discovery through building and electrical permit reviews
- New construction percent complete reviews
- New construction reported with personal property
- Remodeling and demolition reviews
- New subdivisions and land splits reviews
- Comprehensive field reviews
- Reappraisal site reviews
- Requests for informal classification and appraisal reviews
- Appeal reviews
- Natural disaster reviews
- Agricultural land classification reviews

Department field staff update property characteristics and add new construction data to the computer assisted mass appraisal (CAMA) system to reflect a property's status as of January 1 of the current tax year. The web application <u>property.mt.gov</u> provides public access to the ownership and property characteristics maintained in the CAMA system.

Residential Property Characteristics Collected

- Property Site Characteristics
 - Property type
 - \circ Number of living units
 - Site size square feet, acreage, front feet
 - Site topography, access, location and fronting
 - Parking type, quantity and proximity
- Residential Dwelling Characteristics
 - Residential dwelling type
 - Architectural style
 - o Class code
 - Quality grade
 - o Year built
 - o Effective year
 - Year remodeled
 - $\circ \quad \text{Story height} \quad$
 - o Attic
 - Square footage of living area
 - Exterior wall type and finish
 - Roof type and materials
 - Foundation
 - o Basement type, quality and finished square footage
 - Heating/cooling system and fuel type
 - Number of bedrooms
 - Number of baths
 - Number of additional plumbing fixtures
 - Number of fireplace stacks, stories, openings and/or prefabricated fireplaces and stoves
 - Car capacity of garages
 - Percent complete if structure is under construction
 - o View
 - Access to ski terrain or water access
 - Manufactured home make, model, length and width
 - Condominium level, unit type and complex amenities
 - Additions (areas attached to but not included in the square foot living area of the dwelling)
 - Miscellaneous features
- Other building and yard improvements (OBY) located on the property
 - o OBY type
 - Quality grade
 - o Year built
 - o Quantity
 - Physical condition

See Appendix A for more detail on the residential property characteristics collected by the department.

Commercial and Industrial Property Characteristics Collected

- Site Information
 - Property type
 - Number of living units (if applicable)
 - Site size square feet, acreage, front feet
 - Site topography, access, location and fronting
 - Parking type, quantity and proximity
- General building information
 - o Structure type
 - $\circ \quad \text{Class code} \quad$
 - Quality grade
 - o Year built
 - o Effective year
 - Year remodeled
 - Number of units per building
 - Number of identical buildings
- Interior/exterior characteristics per building
 - o Use type
 - o Wall height
 - Exterior wall material
 - Construction class
 - o Area
 - o Interior finish percentage
 - o Partitions
 - Heating system type
 - Air conditioning type
 - Plumbing
 - \circ Physical condition
 - Functional utility
- Building other features
- Elevators/escalators
- Other building and yard improvements (OBY) located on the property
 - OBY type
 - o Year built
 - $\circ \quad \text{Quality grade} \quad$
 - Physical condition
 - o Functional utility

See Appendix B for more detail on the commercial and industrial property characteristics collected by the department.

GEOGRAPHIC DATA

A market area is the broadest area from which comparable sales are selected in the sales comparison approach.

Market areas may be broken up into various subsets of properties called clusters, neighborhood groups, neighborhoods, and sub-neighborhoods. Neighborhoods within a cluster or neighborhood group do not need to be highly homogenous but do need to have similar factors that affect their values (e.g., urban neighborhoods, recreational neighborhoods and farming communities).

A neighborhood is a collection of properties defined by natural, man-made or political boundaries which share locational and physical similarities. Physical, economic, governmental and social influences directly affect a property's value.

Department staff review and analyze existing market areas' neighborhood boundaries and characteristics during the timeframe leading up to a valuation cycle. This ensures the boundaries are accurately established and the properties within the market area boundaries are affected by similar influences. New market areas, clusters, neighborhood groups or neighborhoods may be added as necessary.

SALES VERIFICATION DATA

Accurate sales verification is crucial for reliable and defensible property values.

Department field staff obtain sales price data on all transfers of real property from Realty Transfer Certificates (RTC) collected by the local county clerk and recorder and provided to the department. A sales verification form (see Appendices C-F) is then mailed to the buyers of real estate that department staff have identified as potential market sales. All potentially valid sales are verified as to whether they are valid arms-length transactions; meaning the sales were not affected by unreasonable or unusual influence, control or motivation by either party. <u>ARM 42.20.432</u>

Sales verification includes confirmation of:

- sales price
- sale was an open market arm's length transaction
- date of sale or the date the price was agreed upon
- terms of the sale
- buyers and sellers were knowledgeable about the market
- buyers were aware of the property's condition
- property characteristics are accurate
- any additions or improvement that were made to the property after the sale

Verification can be obtained on-site, by mail, by telephone or using multiple listing services (if available) and internet listings to ensure accuracy of information on the RTC and the property characteristics. Potential additional sources of verification information for commercial and industrial property may include the buyer's and seller's websites, financial documents and press releases along with industry publications and news articles.

The department is required to review and track distressed sales. Foreclosure related transactions must be used in the mass appraisal's model calibration and sales ratio studies if the sales comprise more than 20 percent of the sales in a specific market area. <u>ARM 42.20.432</u>

CONSTRUCTION COST DATA

Local construction cost data is collected statewide on all property types to develop cost tables used in calculating accurate estimates of replacement cost new.

Department staff collect labor costs from the Montana Department of Labor and Industry. Localized costs are obtained from building contractors, lumber yards and retail outlets that provide materials, such as lumber, plumbing fixtures and electrical components to contractors. New construction cost information is gathered during on-site reviews and from the collection of sales data of newly constructed properties.

The department also uses nationally accepted appraisal cost manuals such as Marshall & Swift Residential Cost Handbook, Marshall & Swift Valuation Service Cost Manual, RSMeans Building Construction Cost Manual and Online Data Services and Mining Cost Service to estimate comparative and unit-in-place costs for the development of base cost tables.

The cost approach requires using total construction costs, so both direct and indirect construction costs are collected. Direct costs consist of materials, labor, all sub-contracts, equipment rental, utilities costs, survey and building permits, and contractor's profit and overhead. Indirect costs include architectural and engineering fees, accounting and appraisal fees, title and legal expenses, real estate taxes during construction, insurance, marketing, advertising and sale expenses, construction loan fees and the cost of interim financing.¹

INCOME AND EXPENSE DATA

Income and expense data used in the application of the income approach to value for commercial property is collected statewide from commercial property owners. Commercial property includes property used or owned by a business, a trade, or a corporation (public benefit, mutual benefit or religious), or used for the production of income, and includes industrial property. <u>15-1-101, MCA</u>. Industrial property includes all land used for industrial purposes, improvements, and buildings used to house the industrial process and all storage facilities. <u>15-1-101, MCA</u>. Some examples of commercial property are office buildings, restaurants, shopping centers, hotels, industrial parks, warehouses, factories, light manufacturing and nursing homes.

Every two years, the department relies on commercial property owners to provide their income and expense data for the previous two years. The department analyzes the data submitted online to determine typical market rents, expense percentages and capitalization rates of similar commercial properties. This data is used to develop property type income models used statewide in the mass appraisal process.

Income and expense data is also gathered during the sales verification process and when department appraisers are on-site to complete a new construction property inspection or a property review for an informal review or appeal. During the sales verification process, department staff request income and expense data along with the sales verification information.

The department also utilizes national commercial property publications, databases, and commercial real estate listing services, as references for sales information, income and expense data and capitalization rates.

For industrial property, income and expense data is also requested annually as part of the personal property reporting requirements and during site inspections.

¹ Property Assessment Valuation, Third Edition, International Association of Assessing Officers (IAAO), 2010.

3. VALUATION OF LAND

Credible market land valuation is dependent on strong land models created from vacant and improved sales data. Land values must reflect market value in each neighborhood or market area.

LAND VALUATION METHODS

The sales comparison approach is the primary land valuation method used by the department.

SALES COMPARISON APPROACH

The sales verification process described on page four is the initial step in the sales comparison approach to determine land value. Next, department staff analyze vacant land sales and make time of sale adjustments to the land sales prices to January 1, 2020 to reflect either inflationary or recessionary trends in the market. January 1, 2020 is the valuation date for the 2021-2022 valuation cycle. Department staff may sometimes use valid improved sales in the time trend analysis for the creation of land models to produce reliable and predictive land values as of the valuation date. Sales data from three, four or sometimes five years ago can be considered and used if there is no valid sales data available for the past two years.

When there is not an acceptable number of vacant land sales in a neighborhood or market area, improved sales can be used to determine land value using the following methods:

ABSTRACTION/EXTRACTION METHOD

In the abstraction/extraction method, improvement values obtained from a cost estimation model are subtracted from the sales prices of improved parcels to arrive at a land value estimate. The method is particularly useful in highly developed areas where there are few, if any, vacant land sales.

ALLOCATION METHOD

The allocation method is also known as the land ratio method. For a given type of property and area, there tends to be a consistent overall relationship between land and improvement values. When there are insufficient vacant land sales in a given area, department appraisers look to other comparable areas with sufficient land sales, determine the typical ratio of land value to total value, and apply the ratio to sales of improved parcels in the subject area.

DEVELOPMENT OF LAND VALUATION MODELS

Land valuation models are built from the data gathered by one or more of the land valuation methods just described. The first step to building land models is to stratify the valid land sales into neighborhoods with similar highest and best use, location and market conditions.

Further analysis is then conducted to determine which valid sales will make up each model. Units of comparison such as square feet, acreage and front feet are determined for each market area. Once completed, a base size is then determined for parcels in each market area for the valuation analysis when a subject land size to base land size ratio is to be used in the model. This is considered the base lot method and may consist of an actual or hypothetical subject lot.

Sales are reviewed for possible influence adjustments for location desirability, view and water frontage that could impact value.

Once sales have been collected, adjusted, neighborhood stratified, units of comparison determined, and influential characteristics identified, a land valuation model can be built. The models may be built using regression analysis, a statistical technique for estimating unknown data based on known available data. A regression model is composed of one dependent variable and one or more independent variables. The dependent variable is what is being estimated, such as land value. An independent variable, such as square footage or acreage, is used to predict or explain the dependent variable.

Regression analysis predicts estimated land value through either an additive or multiplicative model. The resulting variables become site adjustment factors within the base lot model. Factors recognize the characteristics of individual parcels, such as differences in size, shape or other market adjustment.

An additive model results in a straight-line equation to predict land market value while a multiplicative model results in a curved-line equation. Both types of models account for economies of scale. The prediction line resulting from either type of model allows for the valuation of similar neighborhoods within a market area.

Basic Additive Model

Y = B + MX

Where:

- Y = regression value/market value
- M = subject land size
- X = land size adjustment factor
- B = base value

Basic Multiplicative Model

$$Y = B \times \left(\frac{M}{K}\right)^X$$
 or $Y = B \times M^X$

Where:

- Y = regression value/market value
- M = subject land size
- X = land size incremental rate
- B = base value
- K = model base size

Final review and testing of the land valuation models is completed to ensure land values per square foot, acre or front foot are equalized. Ratio studies are conducted comparing sales price versus regressed model value. The IAAO standard for an acceptable median assessment ratio is between 0.90 and 1.10.

Once the land valuation models have been built and reviewed, they are loaded into the CAMA system. No changes are made to the land models once they are finalized for the valuation cycle.

4. DEVELOPMENT OF VALUATION MODELS AND APPLICATION OF THE THREE APPROACHES TO VALUE FOR IMPROVED PROPERTY

A. RESIDENTIAL PROPERTY

Residential properties are valued using either the sales comparison approach or cost approach. The sales comparison approach is the preferred valuation method. The income approach is usually not an applicable and relevant approach to value as the highest and best use of residential properties is in most cases, as a residence.

SALES COMPARISON MODELS - DEVELOPMENT

Processes completed to develop the residential sales comparison models include:

- Verification of sales refer to the data collection section for details on the sales verification process.
- Analysis of market areas refer to the geographic data collection section for details on the identification of market areas.
- Review of verified valid improved sales data stored in a sales history extract file in the CAMA system to look for anomalies that should be excluded.
- Development of market condition (time of sale) adjustments that reflect either inflationary or recessionary trends in the market from the time of sale to January 1, 2020, the valuation date for the 2021-2022 valuation cycle.
- Extraction of sales by market area. Sales comparison models can contain 40 to 3,000 or more sales depending on available data for that area.
- Calibration of models. Using multiple regression analysis (MRA), a statistical tool which calculates the sale adjustment factors of various property characteristics such as living area square footage, age, and quality grade. The factors are used to adjust the comparable sales to the subject property.
- Application of selection rules and adjustments. These rules and adjustments are added to the model to help select the most comparable properties.
- Testing and finalization of sales comparison models in the CAMA system. Model results are reviewed by appraisal staff and sales ratio studies are performed, comparing sales prices to regressed model values. IAAO standard on ratio results are between .90 and 1.10.

No changes are made to the models once they are finalized in the CAMA system's production environment for the valuation cycle.

SALES COMPARISON APPROACH TO VALUE

The sales comparison approach estimates the value of a property by statistically analyzing the sale prices of similar properties. Typically, three to five comparable sales selected by the CAMA system as most statistically comparable to the subject property are adjusted for differences such as square feet of living area, condition, desirability and utility (CDU), age, quality grade, basement, etc.

The sale price of each comparable property is adjusted through the MRA process for these differences including the adjustment of the sale date to the valuation date. The highest and lowest adjusted comparable sales values are thrown out and the remaining values averaged. The result is an estimate of value for the subject property based on the adjusted sale prices of the comparable properties.

COST TABLES - DEVELOPMENT

Processes completed to develop the residential cost tables include:

• Collection of construction cost data - refer to collection of data section for details on the cost data collection process.

- Development of base cost tables for replacement cost new (RCN) calculations of:
 - living areas first story, second story, each additional story, and half story;
 - adjustments such as foundation type, basement characteristics, attic, heating and air conditioning, and plumbing fixtures;
 - additions areas attached to but not included in the square foot living area base cost. Additions include porches, attached garages, attached carports, and mobile home additions, etc. Refer to property characteristics in the collection of data section for a complete list of additions;
 - miscellaneous features basement garages, central vacuum system, spa bathtub, miscellaneous built-ins, etc. Refer to property characteristics in the collection of data section for a complete list of miscellaneous features; and
 - other building and yard improvements (OBYs).

The base cost tables are developed from new construction costs gathered locally and from nationally accepted appraisal cost manuals such at Marshall & Swift Valuation Service Cost Handbook. The base cost tables represent **average** cost figures.

• Application of quality grade factors.

Residential dwellings – Quality grade factors represent the overall quality of workmanship and materials assigned to each residential dwelling. Each grade is assigned a grade factor multiplier that is applied to determine replacement cost new. Grade 5 (average) is the base with a factor multiplier of 1.00.

Grade Number	Construction Description	Grade Factor Multiplier
1	Cheap	0.44
2	Poor	059
3	Low Cost	0.73
4	Fair	0.85
5	Average	1.00
6	Good	1.28
7	Very Good	1.56
8	Excellent	2.34
9	Superior	3.11
10	Extraordinary	5.09

Mobile/manufactured home quality grades are alphabetical.

Alphabetical Grade	Construction Description	Grade Factor Multiplier
С	Cheap	0.32
L	Low Cost	0.77
Α	Average	1.00
G	Good	1.26
E	Excellent	1.57

• Development of condition, desirability and utility (CDU) rating and review of depreciation tables for calculation of percent good of the structure.

Depreciation or percent good tables for residential dwellings, mobile/manufactured homes and OBYs are used to determine a percent good. The tables are used to maintain uniformity in the mass appraisal process for tax equalization purposes and reflect typical loss in value from physical deterioration, functional and economic obsolescence based on the year built or effective year of the dwelling.

Depreciation is divided into three categories: physical deterioration, functional obsolescence and economic obsolescence. The department uses a composite rating of condition, desirability and utility (CDU) for a uniform method of estimating the depreciation of a dwelling. Each component of the CDU rating is examined individually. Below are the definitions for each component of CDU.

- Condition overall physical deterioration due to condition.
 - Excellent The residential dwelling is in better than new condition; very attractive and highly desirable. There are no deficiencies in material or construction and no signs of deferred maintenance.
 - Very Good The residential dwelling is in new or like new condition. There are no deficiencies in material or construction and no signs of deferred maintenance.
 - Good The residential dwelling has little to no wear and tear and the structure is slightly more attractive and desirable than average.
 - Average The residential dwelling exhibits normal wear and tear. There are few indications of deferred maintenance and no significant repairs or replacements are necessary.
 - Fair The residential dwelling has some deterioration but is definitely usable. The exterior and interior show wear and deterioration but the property is suitable for use. The structure could be characterized as needing work.
 - Poor The residential dwelling has definite obvious deterioration and is barely usable. Structural elements may require replacement. The exterior and interior are in poor condition and the structure appears barely suitable for use.
 - Very Poor The residential dwelling is in very poor condition and practically unusable. Most structural elements require replacement. The exterior and interior are in dilapidated condition and not suitable for use.
 - Unsound The residential dwelling is unsound and unfit for use. All major structural elements require replacement. The exterior and interior are in a dilapidated condition. The structure is not suitable for use.
- o Desirability location desirability in terms of economic obsolescence
 - Excellent The residential dwelling is in a premium location and may have excellent views, water frontage, golf course frontage, ski access or other unique features.
 - Very Good The residential dwelling's location is highly desirable and has popular amenities. The residential dwelling may be located in a superior subdivision or in a historical or entertainment area.
 - Good The residential dwelling's location is in a popular area with above average amenities.
 - Average The residential dwelling's location is typical of other residential neighborhoods with average amenities.
 - Fair The residential dwelling's location is inferior to other residential neighborhoods and may be impacted by surrounding properties (a commercial or industrial area, for example).
 - Poor The residential dwelling's location is inferior in multiple ways and may have access and/or utility issues and unattractive surroundings.

- Very Poor The residential dwelling's location is in an undesirable area with potential environmental issues.
- Unsound Used only when the residential dwelling is uninhabitable.
- Desirability of the subject property itself, regardless of the location of the property.
 - Excellent The residential dwelling has superior design, quality and curb appeal.
 - Very Good The residential dwelling's style is desirable in design, quality and curb appeal.
 - Good The residential dwelling is attractive in design and curb appeal.
 - Average The residential dwelling is typical and of common design and curb appeal.
 - Fair The residential dwelling is of simple design and low curb appeal.
 - Poor The residential dwelling has very little appeal and desirability.
 - Very Poor The residential dwelling has little to no appeal or desirability.
 - Unsound The residential dwelling has no appeal or desirability. It is unlivable.
- Utility functional utility or amount of functional obsolescence associated with the subject property.
 - Excellent The residential dwelling's functional utility is excellent, and no utility deficiencies exist.
 - Very Good The residential dwelling is very functional. Few utility deficiencies exist for the residential structure and it is well suited to aid the utility of the property to perform the function for which it is intended.
 - Good The residential dwelling has above average utility with minor functional deficiencies. The residential structure is well suited to aid the utility of the property to perform the function for which it is intended.
 - Average The residential dwelling is adequately functional and performs the function for which it is intended.
 - Fair The residential dwelling adds to the utility of the property to perform the function for which it is intended, but the effect is minimal. Renovation is necessary to allow the residential dwelling to make an adequate contribution.
 - Poor The residential dwelling adds little to the utility of the property to perform the function for which it is intended. Major renovation is necessary to allow the residential dwelling to make an adequate contribution.
 - Very Poor The residential dwelling provides little to no utility as it was intended. Significant renovation and redesign of the improvements are necessary to allow the residential dwelling to make an adequate contribution.
 - Unsound The residential dwelling adds nothing to the utility of the property to perform the function for which it is intended. The improvements have no functional utility.

For residential dwellings, each component of CDU is assigned one of the following numerical values.

10	Excellent
9	Very Good
8	Good
7	Average
6	Fair
5	Poor
3	Very Poor
1	Unsound

A dwelling's total CDU rating is calculated by adding the four component's numerical values together and averaging. The CDU rating is a part of the CAMA system's overall depreciation factor.

For mobile/manufactured homes, the department uses the same CDU rating system for depreciation.

• Other building and yard improvements (OBYs) – Application of quality grade factors and physical condition ratings.

Two quality grading systems are used for OBYs. The same numerical quality grade system (1-8) is used for some residential dwelling related structures. For other structures, including all agricultural buildings, an alphabetical grading scale is used. The grade factor is applied to the base cost of each OBY. Grade A and grade 5 (average) is the base with a grade factor of 1.00.

Numerical Grade	Construction Description	Grade Factor
1	Cheap	0.44
2	Poor	0.59
3	Low Cost	0.73
4	Fair	0.85
5	Average	1.00
6	Good	1.28
7	Very Good	1.56
8	Excellent	2.34

Alphabetical Grade	Construction Description	Grade Factor
С	Cheap	0.51
L	Low Cost	0.72
А	Average	1.00
G	Good	1.44
E	Excellent	1.86

Modification codes are used to adjust the property characteristics not included in the base cost, such as plumbing, interior finish and wall height.

For residential OBYs, the physical condition of an OBY bears a direct relationship to the desirability and usefulness of that improvement. The OBY condition rating guide is used to generate a percent good estimate for different types of OBYs.

Residential OBY condition ratings		
Res Excellent	Residential OBY structure is in better than new condition; very attractive and highly desirable.	
Res Good	Residential OBY structure has minor deterioration that is visible; slightly more attractive and desirable, but useful.	
Res Average	Residential OBY structure exhibits normal wear and tear; average attractiveness and desirability.	
Res Fair	Residential OBY structure has marked deterioration but still usable.	
Res Poor	Residential OBY structure has definite deterioration which is obvious; undesirable and barely usable.	

Res Unsound Residential OBY structure is unsound and practically unfit for use.	
---	--

• Review of properties under construction.

For unfinished construction of new structures, remodels and additions, department appraisers estimate the dwelling's level of finished construction as of January 1 of the current tax year. A percent complete table with numerical percentage values for specific construction items is used to estimate the completion percentage.

Construction items included in the percent complete table		
Excavation – footings, foundation, basement, columns	Heating – roughed in	
Joist, subfloor, floor	Insulation, walls and ceiling	
Wall framing (thru top plates)	Drywall or plaster	
Wall sheathing	Interior carpentry	
Roof framing, ceiling joists, sheathing felt	Interior finish -paint, trim and wall cover	
Roof cover	Floor covering	
Exterior felt, siding, exterior trim	Cabinets and countertops	
Windows, exterior doors	Plumbing - finish	
Exterior prime and paint	Electric - finish	
Plumbing – roughed in	Mechanical/heating – finish	
Electric – roughed in	Hardware - finish	

• Development of local county indexes.

When local construction cost data is collected, department staff analyze the data to develop local indexes for use in the cost approach. The department also utilizes local cost indexes from national accepted cost manuals referenced in the collection of data section of this manual. A local cost index factor is applied to a dwelling's replacement cost new less depreciation (RCNLD) value to adjust for local construction costs.

• Development of cost and design factor.

A cost and design factor can be applied for residential dwellings with extraordinary architectural designs or structures of very poor quality. If these structures vary significantly from base specifications in the residential cost tables, a cost and design factor extracted from the market is applied to RCNLD.

• Calculation of economic condition factors (ECF).

Economic condition factors (ECF) are market adjustments used to adjust cost approach values to the market. Residential ECFs are calculated by comparing the average market values to average cost values for each market model. The uniform formula for calculating ECF is:

$$ECF = \frac{1 + (Average Market Value \div Average Cost Value - 1)}{1 - (Total Land Value \div Total Cost Value)}$$

The mobile/manufactured home ECF calculation is dependent on if a mobile/manufactured home market model was developed for a particular area. If a mobile/manufactured home market model was developed, the ECF is calculated similarly to the residential ECF by comparing the average market values to average cost values for a particular mobile/manufactured home market model. However, if a mobile/manufactured home market model was not developed, the ECF is calculated similarly to the average sales prices are calculated

from valid mobile/manufactured home sales, instead of using market values predicted by a market model.

• Testing and finalization of cost models.

Cost tables are tested and finalized in the CAMA system. No changes are made to the tables once they are finalized in the CAMA system's production environment for the valuation cycle.

COST APPROACH TO VALUE

The cost approach can be used to appraise all types of improved property and is frequently used to value unique properties.

The cost approach is used for parcels with non-typical circumstances and when there is insufficient sales data and a reliable market model cannot be developed. Examples include properties with:

- more than one dwelling unit;
- mixed-use properties (residential and commercial improvements);
- a high number of out buildings whose combined value significantly affects the overall property value;
- structures under construction or partially complete;
- land and improvements which are sold separately and typically under different ownership;
- mobile/manufactured homes classified as personal property when no market model exists;
- non-qualified agricultural parcels with land 20 to less than 160 acres that does not meet agricultural qualifications; and
- qualified agricultural parcels.

The steps the department uses to develop an estimate of value by the cost approach are provided below:

- 1. Value land as if vacant.
- 2. Estimate replacement cost new (RCN) of dwelling unit.
 - a. Calculate RCN for living area square footage. The formula for RCN for each level of living area is *base cost + (square foot x per square foot cost)*.
 - b. Make positive or negative base price adjustments to RCN to account for variation in base specifications.
 - c. Add additions costs to RCN.
 - d. Add miscellaneous features cost to RCN.
 - e. Apply quality grade factor to total residential dwelling, adjustments, additions and miscellaneous features value to determine RCN.
- 3. Deduct total accrued depreciation from RCN to determine replacement cost new less depreciation (RCNLD).
 - a. Accrued depreciation is expressed as a percent good derived from the dwelling's CDU rating and effective age.
- 4. Apply multipliers to RCNLD.
 - a. Percent complete factor
 - b. Cost and design factor
 - c. Local county index factor
 - d. Economic condition factor
- 5. For other building and yard improvements (OBY) located on the land, calculate adjusted RCNLD for all OBYs.
- 6. Add OBYs adjusted RCNLD to dwelling unit's adjusted RCNLD.
- 7. Add land value to total adjusted RCNLD to determine cost approach value.

INCOME MODELS - DEVELOPMENT

The department does not build income models for residential property valuation due to the lack of income data for single family residences. In most cases, the highest and best use of a residential property is as a single-family residence.

B. COMMERCIAL AND INDUSTRIAL PROPERTY

Commercial and industrial properties are typically valued using either the income or cost approach. The income approach is the preferred approach to value if relevant data is available.

SALES COMPARISON MODELS - DEVELOPMENT

The department generally does not develop sales comparison market models for commercial property due to the lack of similar sales data.

SALES COMPARISON APPROACH TO VALUE

As stated, due to the lack of similar sales data, the sales comparison approach is not considered a reliable approach to value for commercial property.

For industrial property, the department does track industrial property sales and allows property owners to submit comparable sales data for the department's use in completing a sales comparison approach to value when appropriate.

COST TABLES - DEVELOPMENT

Processes completed to develop the commercial and industrial property cost tables include:

- Collection of construction cost data refer to the collection of data section for details on the cost data collection process.
- Development of the base building construction type cost tables for the ten basic structure types. (Refer to Appendix B in the commercial and industrial property characteristics for structure types.)

The base cost tables are used for the calculation of replacement cost new (RCN) for a building's basement, first floor and upper floor levels and include costs for:

- framing the frame cost rate (dollars per square foot of floor area excluding basement area) as a function of construction class and basic structure type.
- roofing the cost rates for the roof framing and roofing materials (dollars per square foot of floor area covered) as a function of basic structure type. Insulation costs have been included in the roofing materials.
- floor structure the structural floor cost (dollars per square foot of the floor area) as a function of the basic structure type.
- exterior wall material the exterior wall material cost (dollars per square foot of wall area) as a function of material type code and the basic structure type. All wall material costs include insulation, normal openings and appropriate back-up materials when required.
- ceiling and floor finish the ceiling and floor finish cost (dollars per square foot of floor area) as a function of the basic structure type or multi-use type code.
- basement the basement wall cost rate (dollars per square foot of wall area) as a function of the construction class and basic structure type. The cost of waterproofing has been added.
- Development of cost tables for exterior wall materials.

- Development of interior cost tables for specific use type codes. Adjustments are made for:
 - Interior finish percent
 - o Partitions
 - \circ Heating
 - Air conditioning
 - Plumbing

Use type codes indicate how the structure is utilized. Refer to appendix B for a complete list of use type codes for commercial and industrial property.

• Development of cost tables for building other features (BOFs), attached improvements not included in the building area base cost, and other building and yard improvements (OBYs). Refer to appendix B for a complete list of commercial and industrial property BOFs, attached improvements and OBYs.

The base cost tables are developed from new construction costs gathered locally and from nationally accepted appraisal cost manuals referenced in the collection of data section of this manual. The base cost tables represent average cost figures.

• Application of quality grade factor.

Commercial buildings - Quality grade factors representative of the overall quality grade of workmanship and materials are assigned to each commercial/industrial building. The commercial CAMA system uses an alphabetic grading scale with "A" as average quality of construction.

Grade Letter	Construction Description	Grade Factor
L	Low Cost	.74
F	Fair	.84
А	Average	1.00
G	Good	1.32
V	Very Good	1.67
E	Excellent	1.85

- Development of physical condition/functional utility ratings and review of depreciation tables for calculation of percent good of the structure. The percent good of a structure is a function of:
 - \circ $\;$ observed age of the structure (effective age or actual age);
 - physical condition of the structure;
 - functional utility of the structure; and
 - expected normal economic life of the structure (based on structure type and construction class codes).

The depreciation tables are used to maintain uniformity in the mass appraisal for tax equalization purposes and reflect typical loss in value from physical deterioration and ordinary functional obsolescence based on the year built or effective year of the structure. Extraordinary functional obsolescence and economic obsolescence are considered on a case by case basis.

Commercial and industrial interior/exterior line physical condition ratings. A one-digit numeric code is selected denoting the physical condition of the interior/exterior line in relation to its age. Consideration is given to the foundation, frame, exterior walls, roof, heating, air conditioning, lighting and electrical systems, plumbing, internal walls and floor finish.

1 - Poor	Interior/exterior line is structurally unsound. Major structural elements require replacement. The interior is in a dilapidated condition and does not appear suitable for use.
2 - Fair	Interior/exterior line shows marked wear and deterioration, but the property is usable for commercial or industrial purposes. The structure could be characterized as needing work.
3 - Normal	Interior/exterior line shows only minor signs of physical deterioration due to wear and tear. There are a few indications of deferred maintenance and no significant repairs or replacements are necessary.
4 - Good	Interior/exterior line is in new or like new condition. There are no deficiencies in material or construction and no signs of deferred maintenance.
5 - Excellent	A new or a major renovation or rehabilitation of the interior/exterior line has taken place. The major renovation or rehabilitation has altered the condition of the interior/exterior area to that of a much newer building in good condition. The amount of work done to enhance the appearance and structural soundness of the interior/exterior line is far in excess of that required for normal maintenance.

Commercial and industrial interior/exterior line functional utility ratings. A one-digit numeric code is selected denoting the functional utility of the interior/exterior line. Functional utility is defined as the ability of the interior/exterior line to perform the function for which it is intended. It is the combined effect on marketability of the condition, utility and desirability of the property. Consideration is given to architecture, design, layout, sizes and types of rooms and performance standards.

0 - None	The interior/exterior line adds nothing to the ability to perform the function for which the improvements are intended. The improvements can in no way be considered serviceable.
1 - Poor	The interior/exterior line adds little to the ability to perform the function for which the improvements are intended. Major renovation is necessary to allow the improvements to make an adequate contribution to service. There is no off- street parking available in the immediate area.
2 - Fair	The interior/exterior line adds to the ability to perform the function for which the improvements are intended, but the effect is minimal. There is still proper ingress and egress, but minimal off-street parking is available in the area.
3 - Normal	The interior/exterior line adds an adequate amount to the ability to perform the function for which the improvements are intended. There is adequate off-street parking available in the immediate area.
4 - Good	The interior/exterior line has no functional deficiencies and the improvements are well suited to aid the ability to perform the function for which improvements are intended. There is more than adequate off-street parking available in the immediate area.

• Other building and yard improvements (OBYs) – Application of functionality and condition ratings to reflect the overall contribution of each OBY.

Commercial and inc	dustrial OBYs physical condition ratings.	
Com 1 Poor	Commercial OBY structure is in a dilapidated condition. It would be characterized as beyond repair.	
Com 2 Fair	Commercial OBY structure shows signs of deferred maintenance, but the improvement does contribute to the commercial or industrial operation. The improvement could be characterized as needing work.	
Com 3 Normal	Commercial OBY structure shows only minor signs of physical deterioration due to wear and tear. There are few indications of deferred maintenance.	
Com 4 Good	Commercial OBY structure shows no signs of deferred maintenance. It could be characterized as in new or like new condition.	
Com 5 Excellent	Commercial OBY structure has undergone major renovation or rehabilitation. Despite the actual age of the improvement, the effective age has been altered to a much newer improvement in good condition. The amount of work done to enhance the appearance and/or structural soundness of the improvement is more than what is required for normal maintenance.	

Commercial and inc	dustrial OBYs functional utility ratings.
0 - None	The OBY adds nothing to the ability of the property to perform the function for which it is intended. It can in no way be considered serviceable.
1 - Poor	The OBY adds little to the ability of the property to perform the function for which it is intended. Major renovation is necessary to allow the improvement to make an adequate contribution to service.
2 - Fair	The OBY adds to the ability of the property to perform the function for which it is intended, but the effect is minimal.
3 - Normal	The OBY adds an adequate amount to the ability of the property to perform the function for which it is intended.
4 - Good	The OBY has no functional deficiencies and the improvement is well suited to aid the ability of the property to perform the function for which it was intended.

The physical condition and functional utility ratings described above are determined by department appraisers for each interior/exterior line of a commercial or industrial structure and each OBY. The ratings are used in the table below to determine the overall physical condition/functional utility rating of each interior/exterior line and OBY. This rate is then used to establish the percent good of an interior/exterior line or OBY.

Commercial Deprecia	ition - Physic	al Condition/Fund	ctional Utility Rati	ng Table	
Dhusiaal Canaditian	Functional Utility				
Physical Condition	0-None	1-Poor	2-Fair	3-Normal	4-Good
1-Poor	10	9	8	7	6
2-Fair	10	8	6	5	4
3-Normal	8	6	5	3	2
4-Good	7	6	4	2	1
5-Excellent	6	5	3	2	1

• Development of local county indexes.

When local construction cost data is collected, department staff analyze the data to develop local indexes for use in the cost approach. The department also utilizes local cost indexes from nationally accepted cost manuals referenced in the collection of data section of this manual. A local county index factor is applied to the replacement cost new less depreciation (RCNLD) value to adjust for local construction costs.

For Industrial property, the department uses a local cost index factor of 1.00 or 100 percent.

• Calculation of economic condition factors (ECF).

Economic condition factors (ECF) are market adjustments used to adjust cost approach values to the market. The commercial ECF calculation is the same as the residential calculation, except the average sales price is calculated from valid commercial sales, instead of using market values predicted by a market model. The uniform formula for calculating ECF for each market area/neighborhood is:

 $ECF = \frac{1 + (Average \ Sale \ Price \ \div \ Average \ Cost \ Value - 1)}{1 - (Total \ Land \ Value \ \div \ Total \ Cost \ Value)}$

An ECF of 1.00 is used for industrial properties. The department does not include an ECF adjustment on industrial properties because of limited valid sales or income data on industrial properties to compare to cost estimates.

• Testing and finalization of cost models.

Cost models are tested and finalized in the CAMA system. No changes are made to the models once they are finalized in the CAMA system's production environment for the valuation cycle.

COST APPROACH TO VALUE

The cost approach can be used to appraise all types of improved property and is frequently used to value unique properties.

In the CAMA system, the application of the cost approach for a commercial or industrial building is organized by building sections. The sections are separated due to differing physical characteristics or use. A section can share a common wall or part of a common wall with another section or several sections.

Building sections are divided into exterior/interior lines. An exterior/interior line is defined as that portion of a building section having the following identical characteristics:

Dimensions	Exterior Wall Material	Heating System Type
Perimeter	Construction Type	Air Conditions Type
Use Type Code	Interior Finish Percent	Plumbing
Wall Height	Partitions	Physical Condition
Building Level		Functional Utility

The steps the department uses to develop an indication of value for commercial and industrial property by the cost approach are:

- 1. Value land as if vacant.
- 2. Estimate the total exterior wall cost for each exterior/interior line of a building based on the structure and use type.
 - a. Estimate building base rate by utilizing the building construction type cost table (based on the basic structure code, construction type and floor level).
 - b. Make exterior wall rate adjustment to account for variation in exterior wall material base specification.
 - c. Determine perimeter area ratio (PAR) (perimeter of the building ÷ area of the building).
 - d. Determine the adjusted wall rate (exterior wall rate x PAR x wall height).
 - e. Estimate total exterior wall cost (building base rate + adjusted wall rate).
- 3. Estimate the total interior wall cost for each exterior/interior line of a building based on the structure and use type.
 - a. Estimate interior base rate by utilizing the interior cost schedule (based on use code).
 - b. Make adjustments for interior finish percentage, partitions, heating and air conditioning system type and plumbing.
 - c. Determine total interior rate (interior base rate + any adjustments).
- 4. Estimate total square foot rate (total exterior wall cost + total interior rate).
- 5. Estimate total exterior and interior wall cost (total square foot rate x area of interior/exterior lines).
- Estimate the cost of building other features (BOFs) and attached improvements utilizing the cost table based on the BOF type code, unit of measure, and rate per unit.
 Rate per unit x unit of measure = BOF value.
- 7. Estimate total building cost (total exterior and interior wall costs + BOF values).
- 8. Apply quality grade factor to total building cost to determine replacement cost new (RCN).
- 9. Deduct total accrued depreciation from RCN to determine replacement cost new less depreciation (RCNLD).
 - a. Accrued depreciation is expressed as a percent good derived from the physical condition/functional utility rating and effective age.
- 10. Apply multipliers to RCNLD.
 - a. Percent complete factor
 - b. Local county index factor
 - c. Economic condition factor
- 11. For other building and yard improvements (OBYs) located on the land, calculate RCNLD for all OBYs.
- 12. Add OBYs RCNLD to total adjusted RCNLD.
- 13. Add land value to total improvement RCNLD to determine cost approach value.

INCOME MODELS – DEVELOPMENT

The department creates income models for the following primary building types:

- o Apartment
- o Hotel/Motel
- Mini-warehouse
- o Office
- o Restaurant
- o Retail
- o Warehouse
- Other Units:
 - Boat Storage/Marina
 - Mobile Home RV Park

Parking Lot or Garage

Additional models may be developed when sufficient income and expense data and sales information is available for other property types.

The primary building type identifies the predominant use of the property, primary source of income and the capitalization rate that will be used in calculating the property value.

Processes completed to develop the income models for commercial property valuation.

- Collection of income and expense data refer to collection of data section for details on the income and expensed data collection process.
- Stratification of income properties by:
 - primary building type;
 - o location; and
 - other property characteristics may be considered such as effective age, size, condition and quality grade.

Individual income models for all primary building types are created for each of the seven largest urban centers in the state: Butte, Great Falls, Billings, Missoula, Helena, Bozeman and Kalispell. In addition, three rural models are built for each primary building type.

- State A rural model includes cities/towns that have defined local government, police and fire department paid or partly paid, established regional medical facility such as a hospital and nursing home, and generally a class A school.
- State B rural model includes smaller city/towns than found in State A model. Typically, an incorporated town with established police protection, volunteer fire protection service, small hospital or nursing home and generally a class B school.
- State C rural model includes very small towns and all areas not defined in another model. Towns may be incorporated with limited or no police protection and volunteer fire protection service. Typically, no medical services and generally has a class C school.

Alternative grouping of models maybe used when there is a limited amount of income and expense information and commercial sales data available.

• Calibration of income and expense data.

Department staff analyze and normalize income and expense data collected to develop typical rent ranges and expense percentages for each primary building type through an analysis of similar properties.

• Calculation of potential gross income (PGI).

PGI is the total annual rent a property would produce at 100 percent occupancy.

Rent ranges are developed using reported rents by primary building type and are localized by income model groups. A minimum and maximum market rent for each primary building type is determined. The rent range is incrementally implemented between nine rent rates.

• Determination of vacancy and collection losses.

• Calculation of other income.

Many properties may produce additional income from coin-operated laundries, parking, concessions, recreational facilities, etc.

• Calculation of effective gross income (EGI).

Effective gross income is equal to the sum of market rent less vacancy and collection loss plus other income.

• Analysis of expenses.

Normal expenses are those that are necessary under typical management to operate and maintain a property and provide for replacement reserves.

Allowable expenses used in the income models		
Advertising	Payroll and Benefits	
Management	Supplies	
Repairs	Other	
Fees and Commissions	Insurance	
Legal/Accounting	Ground Rent Paid	
Utilities	Reserves for Replacement	
Cleaning and Maintenance		

Expenses collected but not allowed for appraisal purposes include capital expenses, depreciation, debt service, mortgage expenses and property taxes. These expenses are collected to accurately calculate net operation income and make sure they are not duplicated or included in an allowed expense category.

When department staff develop the expense percentages to be used in a model, only properties that have a positive net operating income (NOI) calculated from reported income and expense data are used.

Expense percentages are determined by using the median percent of all occurrences within the expense being analyzed. The median is the midpoint of an arrayed distribution of values and less affected by extreme high or low observations than average. Expenses per square foot are calculated as a percentage of the effective gross income (EGI).

Anomalies for non-recurring revenues and atypical expenses are stabilized by using the median modeled operating expenses to reflect typical operating expense percentages.

Normalization of net operating income (NOI)

NOI = EGI - Expenses

• Development of capitalization rate.

Commercial properties determined to be a valid sale and have provided income and expense information are used to develop the capitalization rate. The capitalization rate expresses the relationship between net income and value where value is represented by properties that have sold and income is represented by properties that reported a positive net operation income.

Capitalization Rate = Income ÷ Value

The capitalization rate developed by the department is an overall rate and is inclusive of the effective tax rate (ETR).

• Calculation of effective tax rate

The effective tax rate is expressed as a portion of the overall capitalization rate and is calculated by multiplying a property's assessment level (mill levies) by its nominal tax rate (taxable percentage).

A median statewide ETR is developed to express an estimate of the portion of the overall rate for taxes.

• Determination of income multiplier.

Properties that have sold and have a positive gross income can be used to calculate the income multiplier. Gross income multiplier (GIM) is used with annualized income and gross rent multiplier (GRM) is used with monthly income.

Income Multiplier = Sales Price ÷ Gross Income (annual or monthly)

• Testing and finalization of income models.

Income models are analyzed to ensure data is entered correctly in CAMA system and when applied to income properties, the models produce accurate results when compared to properties that have sold. No changes are made to the models once they are finalized in the CAMA system's production environment for the valuation cycle.

INCOME APPROACH TO VALUE

Income producing property is typically bought and sold on its ability to generate and maintain an income stream. The income approach converts future benefits of property ownership into an indication of present worth (market value). Present worth, which is the result of capitalizing net income, is the amount a prudent investor would be willing to pay now for the right to receive the future income stream.

The income approach is based on the theory that the market value of income producing property is related to the amount, duration and certainty of its income producing capacity.

Using the income approach, the department values all commercial properties by using income and expense data collected from similar properties.

The steps used to value commercial property by the income approach are:

- 1. Estimate potential gross income (PGI).
- 2. Deduct vacancy and collection loss.
- 3. Add miscellaneous income to arrive at effective gross income (EGI).
- 4. Deduct expenses from EGI to determine the net operating income (NOI).
- 5. Determination of market value with development of a:
 - capitalization rate; net operating income ÷ capitalization rate = market value; or
 - gross income multiplier (GIM); gross income x factor (GIM) = market value.

The department may use a gross income multiplier for apartment complexes with eight units or less.

The steps used to value industrial property by the income approach are:

- 1. Develop a discount rate for the industry being valued.
- 2. Company provided income and expense information is utilized to project net cash flows combined with a terminal value.
- 3. Yield capitalization, direct capitalization and/or other approaches, as deemed necessary, are utilized to convert the sum of the net cash flows and terminal value into an indication of present value.
- 4. Income approach conclusion of value is reconciled with the cost approach and sales approach (if applicable) to determine an industrial site's market value.

5. RECONCILIATION AND DETERMINATION OF FINAL VALUE

In reconciliation, department appraisers use their experience, expertise and professional judgment to resolve differences among the value estimates derived from the application of the approaches to value. The greatest weight is given to the approach to value that is most credible given the available data.

RESIDENTIAL PROPERTY

The sales comparison approach is the preferred approach to value for most residential properties and is given greatest weight when the comparable property's adjustments are within 200 comparability points or less and the location is similar. The multiple regression analysis (MRA) calculation of value which is generated through the sales comparison approach can also be selected as a final value for a property.

The cost approach is used for residential parcels with non-typical circumstances described in the residential cost approach section of this manual, when the comparability adjustment points are too high or if the appraiser feels that the comparable properties are not similar.

COMMERCIAL PROPERTY

The income approach is the preferred approach to value for commercial property. The cost approach is used to value unique properties or when an income model does not exist for a property's use type. The cost approach will be considered the appropriate approach to value when the department appraiser determines a property's land value is the predominate factor of its overall land and building value.

INDUSTRIAL PROPERTY

The cost approach is typically used to value industrial property. The department does invite industrial property owners to provide comparable sales data and income and expense data to aid in the department's development of a sales comparison and/or income approach to value.

APPENDICES

APPENDIX A - RESIDENTIAL PROPERTY CHARACTERISTICS DETAIL

Here is an example of a property record card provided in <u>property.mt.gov</u>. Users can search for a property by entering the property owner's name, address, geocode or assessment code.

Class Code

A complete list of the different property class codes is available at <u>MTRevenue.gov</u>.

Quality Grade – Residential Dwellings

There are ten grades for residential dwellings. Grade represents quality and applies to architectural design, workmanship and type of materials. The combination of quality workmanship and materials reflects increased cost and value.

The grading of structures is used to distinguish between variations in value and to identify the full range of conventional single-family residential construction. The value of a dwelling constructed of highquality materials and with the best of workmanship throughout may be considerably more than that of one built from the same floor plan with inferior materials and workmanship.

The residential system uses a numerical grading scale with 5 being the average quality of construction and a range of grades from a low of 1 (cheap construction) to a high of 10 (extraordinary construction). A brief description of each residential grade is provided below. Refer to appendix A for detailed construction specifications within each grade.

Grade 1 - Cheap Quality Residences are of very low-cost construction built with low quality materials and substandard workmanship. These residential structures will not meet minimum building code requirements. Exterior and interior finishes are very plain. These structures are built for minimal habitation and are distinguished by the absence of a perimeter foundation, plumbing, and heating system.

Grade 2 - Poor Quality Residences are of substandard construction built with low cost materials and below average workmanship. These residential structures will not meet most minimum building code requirements. Exterior and interior finishes are plain with little or no trim. These houses are built for function, with little attention to design.

Grade 3 - Low Cost Quality Residences are of low-cost construction built with low cost materials and average workmanship but will meet most minimum building code requirements. Exterior and interior finishes are plain, minimum fenestration with inexpensive sash and little or no trim. These homes are built for function, not appearance.

Grade 4 – Fair Quality Residences are of fair quality construction built with average materials and workmanship. These houses will meet minimum building codes and construction requirements of lending institutions and mortgage insuring agencies. Exterior ornamentation is usually limited to the front elevation and with a minimum amount of inexpensive fenestration. Interior finishes are plain with few refinements. These homes are usually designed from stock plans for speculative residential developments.

Grade 5 – Average Quality Residences are of average construction built with average quality materials and acceptable workmanship. These houses will meet or exceed minimum building codes and the construction requirements of lending institutions and mortgage insuring agencies. Exterior ornamentation is frequently limited to the front elevation but with an adequate amount of standard quality aluminum or wood sash fenestration. Interior finishes and trim are simple. Doors are medium grade, hollow core with stock hardware. These homes are frequently designed for mass production.

Grade 6 – Good Quality Residences are of good quality construction built with good quality materials and workmanship and will have some custom craftsmanship. These houses will exceed minimum building codes and construction requirements for lending institutions and mortgage insuring agencies. Exterior ornamentation reflects some attention to detail with ample and good quality fenestration throughout. Interiors are well finished usually with good quality wall treatments and trim, doors are good quality hollow core with attractive hardware. These homes are frequently custom built but may be mass produced in above average residential developments. **Grade 7 – Very Good Quality Residences** are of high-quality construction built with high-quality materials, workmanship and custom craftsmanship. Exterior ornamentation shows refinements with good quality fenestration throughout. Interiors are well finished with good quality wall coverings or wood paneling and hardware. These homes are usually individually designed.

Grade 8 – Excellent Quality Residences are of highest quality construction built with best quality materials and workmanship with custom craftsmanship throughout. Exterior ornamentation reflects considerable attention to detail with well-designed high-quality fenestration. Interiors are well finished with highest quality wall coverings or hardwood paneling. These homes are individually designed and are usually unique; however, the base specifications do not represent the highest costs in residential construction.

Grade 9 – Superior Quality Residences are of superior quality construction built with best quality materials and workmanship with custom craftsmanship throughout with considerable attention to detail and are typically unique in design. Exterior ornamentation reflects considerable attention to detail with well-designed superior quality fenestration. Interiors are superbly finished with superior quality wall coverings or hardwood paneling; however, the base specifications do not represent the highest costs in residential construction.

Grade 10 – Extraordinary Quality Residences are of superior quality construction built with best quality materials and workmanship with custom craftsmanship throughout with considerable attention to detail. Exterior ornamentation reflects considerable attention to detail with well-designed superior quality fenestration. Interiors are superbly finished with superior quality wall coverings or hardwood paneling. These homes are individually designed and are usually unique; however, the base specifications do not represent the highest costs in residential construction.

Quality Grade – Mobile/Manufactured Homes

For mobile/manufactured homes, the residential grade system uses an alphabetic grading scale.

Grade C- Cheap quality mobile/ manufactured homes are generally built prior to June 15, 1976 and do not meet the Federal Manufactured Home Construction and Safety Standards as outlined in Title VI, Housing and Development Act of 1974. These mobile homes are built for minimal habitation. Workmanship and materials are of the cheapest quality, with no attention to design. Ceiling height is typically 7'-7'6".

Grade L – Low Cost Quality mobile/manufactured homes are generally built to minimum construction standards established by the industry and most states. Workmanship and materials are of below average quality, with little or no attention to design. Ceiling height is typically 7'-7'6". Roofs may be arched or a low gable.

Grade A – Average quality mobile/manufactured homes will usually meet or exceed mobile home code and manufactured home construction standards requirements. Materials and workmanship are of average quality. Interior finishes are simple. Ceiling height is typically 7'6" – 8' With a gable roof.

Grade G – Good quality mobile/manufactured homes will generally exceed minimum mobile home code and manufactured home construction standard requirements. With these mobile/manufactured homes some detail and ornamentation is given to interior finishes and exterior design. These mobile/manufactured homes typically have a gable roof with an 8'0" ceiling height with some vaulted areas.

Grade E – Excellent quality mobile/manufactured homes will exceed minimum requirements of mobile home codes and manufactured home construction standards. Exterior and interior finishes are similar to

the quality of those found in site-built residences, with attention given to ornamentation and trim. Ceiling heights are typically 8'0" with some vaulted areas.

Story Height

	percent of total square footage has 6	
	foot or taller wall height (usable area).	
4	Fully Finished with Dormers –	
	Approximately 55 percent of total	
	square footage has 6 foot or taller wall	
	height (usable area).	

Square Foot Living Area (SFLA)

The square footage of the total above grade finished living area.

Year Built

Year built refers to the original date of construction.

Effective Year

Effective year, when used, will determine effective age and is the age of a structure with respect to condition and utility, as of the valuation date. Effective year is an optional entry on the property record card. If effective year is determined by the department appraiser, it will override the year of construction in determining the depreciation for the structure. If the condition of a structure is better than average, the effective year will be more recent than the actual year built. If the condition is worse than average, the effective year may be prior to the actual year built. Even in the same markets, similar structures do not necessarily depreciate at the same rate. The maintenance standards of owners or occupants can influence the pace of depreciation.

Year Remodeled

Refers to the date of the last extensive remodeling. This field is descriptive only and does not affect depreciation calculations. Appraisers use this information to help determine the correct effective year for the structure.

3	Full	

Daylight Basement

Yes or No entry. To qualify as a daylight basement, one or both of the following conditions must be met:

- The major portion of at least one wall must be exposed and the outside entrance must be at ground level.
- Residential dwellings with four feet or more of the basement above grade are considered to have daylight basements.

Finished Basement Area

Square footage of finished basement area.

Basement Finish Quality

1	Minimal – Refers to a relatively open undivided area finished with a cheap quality of materials and workmanship inconsistent with the main living area of the dwelling.
2	Fair – Refers to an area with minimal partitioning finished with low-quality materials and workmanship that is below the quality of the main living area of the dwelling.
3	Typical – Refers to a divided area finished with a quality of materials and workmanship consistent with the main living area of the dwelling.
4	Good – Refers to a divided basement area finished with a quality of materials and workmanship higher than that of the main living area of the dwelling.

Bedrooms

Independent living areas with a privacy door and a reach-in or walk-in closet for clothes storage and a window are counted as bedrooms. Rooms in a basement are counted as bedrooms if the room has a privacy door, reach-in or walk-in closet and a window. The window does not have to be an egress window (four feet by four feet). If a room meets the above criteria but is being utilized for some other purpose (such as a den), it is included in the bedroom count.

Full Baths

Number of three fixture bathrooms which include a sink, toilet and bathtub or shower stall. A bathtub with a shower head is considered one fixture.

Half Baths

Number of two fixture bathrooms which include a sink and toilet.

Fireplace Stacks

Number of chimneys for wood burning fireplaces constructed of masonry.

Fireplace Stories

For each chimney stack, department staff count the number of stories of the portion of the building where the chimney stack is attached. The story heights of all chimney stacks are added to together.

Fireplace Openings

Number of fireplace openings for each chimney. All openings from all chimney stacks are added together.

Prefabricated Fireplace and Stove

Number of prefabricated fireplaces and stoves.

Additional Fixtures

Individual plumbing fixtures are those not counted in full baths or half bath counts. Additional fixtures can include water heaters, kitchen sinks, wet bars, sinks in recreation areas, laundry tubs and automatic washer hookup.

Garage Car Capacity

Number of garage stalls associated with the dwelling. (For informational use only.)

Percent Complete

For unfinished construction – new structures, remodels and additions. An overall percentage is determined based on the level of finished construction as of January 1 of the current tax year.

View

Golf course, lake or mountain views.

Access Amenities

Ski, golf course or water access.

Manufactured Home Make, Model Length and Width

Exterior measurements are used to determine width and length of mobile homes.

Additions

Residential additions are areas attached to but not included in the square foot living area of the dwelling. Additions are reported according to their floor level (lower level or basement, first floor, second floor or third (any floor above second floor).

COMMERCIAL AND INDUSTRIAL STRUCTURES CHARACTERISTICS

Commercial/Industrial Structure Type

The structure type code describes the primary purpose of the commercial/industry building as a whole. A building may have been constructed for multiple purposes, but only one structure type code is used to describe the building as a whole. Individual areas within the building will be defined by their use type. The complete list of all commercial/industrial structure types is not provided in this manual. The structure type description is displayed on the property record card found in <u>property.mt.gov</u>.

Class Code

A complete list of the different property class codes is available at MTRevenue.gov.

Quality Grade

L	Low Cost
F	Fair
А	Average
G	Good
V	Very Good
Е	Excellent

Year Built

Year structure was built. If owner or tenant does not know the actual year, department appraisers enter the best estimate possible.

Effective Year

Effective year, when used, will determine effective age and is the age of a structure with respect to condition and utility, as of the valuation date. Effective year is an optional entry on the property record card. If effective year is determined by the department appraiser, it will override the year of construction in determining the depreciation for the structure. If the condition of a structure is better than average, the effective year may be prior to the actual year built. If the condition is worse than average, the effective year may be prior to the actual year built. Even in the same markets, similar structures do not necessarily depreciate at the same rate. The maintenance standards of owners or occupants can influence the pace of depreciation.

Year Remodeled

Refers to the date of the last extensive remodeling. This field is descriptive only and does not affect depreciation calculations. Appraisers use this information to help determine the correct effective year for the structure.

Number of units per building

Number of measurable units applicable for the building structure type coded.

Number of identical buildings

Number of identical buildings located on the parcel.

INTERIOR/EXTERIOR CHARACTERISTICS PER BUILDING

Use Type

Use type code describes the current use of the interior/exterior line.

Use Code	Use Description	Use Code	Use Description

04	Brick and Concrete Block
05	Tile
06	Masonry and Frame
07	Metal, Light
08	Metal, Sandwich
09	Concrete Load Bearing
10	Concrete Non-Load Bearing
11	Glass
12	Glass/Masonry
13	Enclosure
14	Concrete Tilt Up
15	Solar Glass
16	Asbestos Corrugated Rigid
17	Native Stone

Type of exterior wall material of an interior/exterior line.

Construction Class

Log

Class of construction of the interior/exterior line.

1	Wood Frame/Joist Beam
2	Fire Resistant
3	Fireproof
4	Pre-Engineered Steel

Area

18

Gross square foot area of the interior/exterior line.

Interior finish percentage

Extent of interior finish based on structure type code and use type of interior/exterior line.

Partitions

Describes the extent of interior partition walls within the interior/exterior line.

0	None	Indicates there are no interior partitions in structure.
1	Below Normal	Indicates most similar structures typically have more partitions than the subject structure.
2	Normal	Indicates the interior has about the same extent of partitioning that is typically found in similar structures used for the same purpose.
3	Above Normal	Indicates structure has extensive interior partitioning when compared to similar structures used for the same purpose.

Heating System Type

Predominant heating system type utilized within the interior/exterior line.

-	
0	None
1	Hot Air
2	Hot Water or Steam
3	Unit Heaters or Space Heaters
4	Electric
5	Heat Pump
6	Solar

Air Conditioning Type

Type of air conditioning within the interior/exterior line.

0	None
1	Central
2	Unit – Air conditioning to the structure provided by individual units that are valued as real property.

Plumbing

Describes the extent and adequacy of the plumbing and piping system within the interior/exterior line in comparison to similar structures.

0	None
1	Below Normal
2	Normal
3	Above Normal

Building Other Features

The type, number of and value of all miscellaneous features are displayed on the property record card in property.mt.gov.

Elevators/Escalators

The type, number of and value of all elevators/escalators are displayed on the property record card in property.mt.gov.

Other Buildings & Yard Improvements (OBYs)

OBYs are additional structures or site improvements that are not part of the principle structure located on a property. Each OBY is evaluated as to its function and condition. The list of all commercial and industrial OBYs is not provided in this manual. The description of each OBY is displayed on a property record card provided in <u>property.mt.gov</u>.

Physical Condition

Description of the physical condition of the interior/exterior line in relation to its age. Consideration is given to the foundation, frame, exterior walls, roof, heating, air conditioning, lighting, and electrical systems, plumbing, internal walls and floor finish.

1	Poor
2	Fair
3	Normal
4	Good
5	Excellent

Functional Utility

Description of the functional utility of the interior/exterior line in relation to current market expectations. Consideration is given to architecture, design, layout, sizes and types of rooms.

0	None
1	Poor
2	Fair
3	Normal
4	Good
